NAME

   mbset − Sets values in **mbprocess** parameter files.

VERSION

   Version 5.0

SYNOPSIS

   mbset −I*infile* **[−E −L −P***PARAMETER:value* **−V −H***]*

DESCRIPTION

   mbset is a utility for creating and modifying **mbprocess** parameter files.

   The program **mbprocess** can perform a variety of swath data processing functions in a single step (producing a single output swath data file), including:
   – Merge edited navigation generated by **mbnavedit**.
   – Apply bathymetry edit flags from **mbedit**
     and **mbclean**
   – Recalculate bathymetry from raw travel time and
     angle data by raytracing through water sound speed
     models from **mbvelocitytool** or **mbsvplist**.
   – Apply changes to roll bias, pitch bias, heading
     bias, and draft values.
   – Recalculate sidescan from raw backscatter samples
     (Simrad multibeam data only).
   – Apply tides to bathymetry.
   – Insert metadata.

   The actions of **mbprocess** are controlled by text parameter files. Each **mbprocess** parameter file contains single line commands that set processing modes and parameters. The **−P** option of **mbset** is used to modify a single **mbprocess** parameter command. This option can be invoked as many times as desired on the command line, allowing **mbset** to set multiple **mbprocess** processing parameters and modes. If the swath data file specified by the **−I***infile* option of **mbset** has an existing **mbprocess** parameter file, then that parameter file will be read and the existing parameter values will be modified. If no **mbprocess** parameter file exists, then **mbset** starts with default processing parameters, modifies those, and then generates a new parameter file.

   If the input file specified by the **−I** option is a single swath data file, **mbset** will act on that file and it's parameter file only. If the input file is a datalist, then **mbset** will act on all swath files extracted from the datalist (and any recursively parsed datalist files). This function allows users to easily set uniform processing parameters for large numbers of data files. The default input file is "datalist.mb-1".

   The processing parameter file used by **mbprocess** has an ".par" suffix. In addition to **mbset**, these files are generated or modified by **mbedit**, **mbnavedit**, **mbvelocitytool**, **mbnavadjust**, and **mbclean**.

   The processed output swath files produced by **mbprocess** are named using a convention based on the data format id. **MB-System** data formats are specified using two-digit or three-digit numbers (see the **MBIO** manual page). If an input swath data file is named "root.mbXX", where XX is the format id, then the default processed output file will be "rootp.mbXX" (e.g. mydata.mb71 −> mydatap.mb71). The "p" inserted before the ".mbXX" suffix indicates the output file has been created by **mbprocess**. If the input file does not follow the *.mbXX naming convention, then the output filename will just consist of the input name with "p.mbXX" added as a suffix (e.g. mydata −> mydatap.mb71)

MBPROCESS PARAMETER FILE COMMANDS
The **mbprocess** parameter file commands modified by **mbset** are:

GENERAL PARAMETERS:
 EXPLICIT
     causes mbprocess to set modes implicitly
     − e.g. the SVPFILE command will also set
       raytracing on even if the RAYTRACE command
       is not given [explicit mode commands required]
 FORMAT constant
     sets format id [no default]
 INFILE filename
     sets input file path [no default]
 OUTFILE filename
     sets output file path [no default]

NAVIGATION MERGING:
 NAVMODE boolean
     sets navigation merging [0]
       0: navigation merge off
       1: navigation merge on
 NAVFILE filename
     sets navigation file path [no default]
 NAVFORMAT constant
     sets navigation file format [9]
           see the **mbprocess** man page for
           documentation of the supported
           navigation formats.
 NAVHEADING boolean
     sets heading to be merged from navigation file
     − note: heading merged from navigation before
       heading correction applied
       0: heading not changed
       1: heading merged from navigation file
 NAVSPEED boolean
     sets speed to be merged from navigation file
       0: speed not changed
       1: speed merged from navigation file
 NAVDRAFT boolean
     sets draft to be merged from navigation file
     − note: draft merged from navigation before
       draft correction applied
       0: draft not changed
       1: draft merged from navigation file
 NAVATTITUDE boolean
     sets roll, pitch and heave to be merged from
     navigation file
     − note: roll, pitch, and heave merged from
       navigation before roll bias and pitch bias
       corrections applied
       0: roll, pitch, and heave not changed
       1: roll, pitch, and heave merged from
         navigation file
 NAVINTERP boolean

       sets navigation interpolation algorithm [0]
        0: linear interpolation (recommended)
        1: spline interpolation
     NAVTIMESHIFT constant
       sets navigation time shift (seconds) [0.0]
       − note: time shift added to timestamps of
        navigation fixes read in from NAVFILE
        prior to merging

NAVIGATION OFFSETS AND SHIFTS:
   NAVSHIFT boolean
       sets navigation offset [0]
       − note: offsets and shifts are applied to navigation
        values from both survey and navigation records, and
        are applied to navigation read in from
        NAVFILE prior to merging
       − note: offsets and shifts are NOT applied to adjusted
        navigation values from NAVADJFILE
   NAVOFFSETX constant
       sets navigation athwartship offset (meters) [0.0]
       − note: the effective navigation shift is
        (NAVOFFSETX − SONAROFFSETX), and the
        navigation is corrected by subtracting
        this effective shift.
       − note: athwartship shift is positive to
        starboard.
   NAVOFFSETY constant
       sets navigation fore-aft offset (meters) [0.0]
       − note: the effective navigation shift is
        (NAVOFFSETY − SONAROFFSETY), and the
        navigation is corrected by subtracting
        this effective shift.
       − note: fore-aft shift is positive forward.
   NAVOFFSETZ constant
       sets navigation vertical offset (meters) [0.0]
       − note: this value is not yet used for
        anything.
       − note: vertical shift is positive down.
   NAVSHIFTLON constant
       sets navigation longitude shift (degrees) [0.0]
   NAVSHIFTLAT constant
       sets navigation latitude shift (degrees) [0.0]
   NAVSHIFTX constant
       sets navigation longitude shift (meters) [0.0]
   NAVSHIFTY constant
       sets navigation latitude shift (meters) [0.0]

ADJUSTED NAVIGATION MERGING:
   NAVADJMODE mode
       sets navigation merging from mbnavadjust [0]
       − can apply to longitude and latitude only
        or longitude, latitude, and depth offset
        0: adjusted navigation merge off
        1: adjusted navigation merge on

        2: adjusted navigation and depth offset merge on
   NAVADJFILE filename
        sets adjusted navigation file path
        − this file supercedes navigation file for
          lon and lat only
        − uses mbnavadjust output
   NAVADJINTERP boolean
        sets adjusted navigation interpolation algorithm [0]
          0: linear interpolation (recommended)
          1: spline interpolation

   ATTITUDE MERGING:
    ATTITUDEMODE mode
        sets attitude (roll, pitch, and heave) merging [0]
        − roll, pitch, and heave merged before
          roll bias and pitch bias corrections applied
        − attitude merging from a separate file supersedes
          attitude merging from a navigation file
          0: attitude merging off
          1: attitude merging on
    ATTITUDEFILE filename
        sets attitude file path
    ATTITUDEFORMAT constant
        sets attitude file format [1]
        − attitude files can be in one of four ASCII
          table formats
          1: format is <time_d roll pitch heave>
          2: format is <yr mon day hour min sec roll pitch heave>
          3: format is <yr jday hour min sec roll pitch heave>
          4: format is <yr jday daymin sec roll pitch heave>
        − time_d = decimal seconds since 1/1/1970
        − daymin = decimal minutes start of day
        − roll = positive starboard up, degrees
        − pitch = positive forward up, degrees
        − heave = positive up, meters

   SONARDEPTH MERGING:
    SONARDEPTHMODE mode
        sets sonardepth merging [0]
        − sonardepth merged before
          draft corrections applied
        − sonardepth merging from a separate file supersedes
          draft merging from a navigation file
          0: sonardepth merging off
          1: sonardepth merging on
    SONARDEPTHFILE filename
        sets sonardepth file path
    SONARDEPTHFORMAT constant
        sets sonardepth file format [1]
        − sonardepth files can be in one of four ASCII
          table formats
          1: format is <time_d sonardepth>
          2: format is <yr mon day hour min sec sonardepth>
          3: format is <yr jday hour min sec sonardepth>

4: format is <yr jday daymin sec sonardepth>
– time_d = decimal seconds since 1/1/1970
– daymin = decimal minutes start of day
– sonardepth = sonar depth positive down, meters

DATA CUTTING:
DATACUTCLEAR
   removes all existing data cutting commands
DATACUT kind mode min max
   adds new data cutting command, where:
     kind = 0 : cut applied to bathymetry data
     kind = 1 : cut applied to amplitude data
     kind = 2 : cut applied to sidescan data
     mode = 0 : no data are flagged or zeroed
     mode = 1 : min and max indicate start and end
         beam/pixel numbers between which data
         are flagged or zeroed
     mode = 2 : min and max indicate start and end
         acrosstrack distance (m) between which
         data are flagged or zeroed
     mode = 3 : min and max indicate minimumn and
         platform speed (km/hr) between which
         data are flagged or zeroed
BATHCUTNUMBER min max
   adds new bathymetry data cutting command where
   min and max are the start and end beam numbers
   between which data are flagged (note that
   flagging bathymetry also flags amplitude data)
BATHCUTDISTANCE min max
   adds new bathymetry data cutting command where
   min and max are the start and end acrosstrack
   distance (m) between which data are flagged
   (note that flagging bathymetry also flags
   amplitude data)
BATHCUTSPEED min max
   adds new bathymetry data cutting command where
   all beams are flagged for pings with a ship
   or vehicle speed less than min or greater than
   max (note that flagging bathymetry also flags
   amplitude data)
AMPCUTNUMBER min max
   adds new amplitude data cutting command where
   min and max are the start and end beam numbers
   between which amplitude data are zeroed (note
   that zeroing amplitude data has no impact on
   bathymetry data)
AMPCUTDISTANCE min max
   adds new amplitude data cutting command where
   min and max are the start and end acrosstrack
   distance (m) between which amplitude data are
   zeroed (note that zeroing amplitude data has
   no impact on bathymetry data)
AMPCUTSPEED min max
   adds new amplitude data cutting command where

all amplitude values are zeroed for pings with
a ship or vehicle speed less than min or greater
than max (note that zeroing amplitude data has
no impact on bathymetry data)

SSCUTNUMBER min max
adds new sidescan data cutting command where
min and max are the start and end pixel numbers
between which sidescan data are zeroed (note
that zeroing sidescan data has no impact on
bathymetry data)

SSCUTDISTANCE min max
adds new sidescan data cutting command where
min and max are the start and end acrosstrack
distance (m) between which sidescan data are
zeroed (note that zeroing sidescan data has
no impact on bathymetry data)

SSCUTSPEED min max
adds new sidescan data cutting command where
all sidescan values are zeroed for pings with
a ship or vehicle speed less than min or greater
than max (note that zeroing sidescan data has
no impact on bathymetry data)

BATHYMETRY EDITING:
EDITSAVEMODE boolean
turns on reading edit save file (from mbedit) [0]

EDITSAVEFILE filename
sets edit save file path (from mbedit) [none]

BATHYMETRY RECALCULATION:
SVPMODE mode
sets usage of a water sound speed model (sound
velocity profile, or SVP) [0]
 0: bathymetry recalculation by raytracing off
 1: bathymetry recalculation by raytracing on
 2: translate depths from corrected to uncorrected
    or vice versa depending on SOUNDSPEEDREF
    command

SVPFILE filename
sets SVP file path [no default]

SSVMODE boolean
sets surface sound velocity (SSV) mode [0]
 0: use SSV from file
 1: offset SSV from file (set by SSV command)
 2: use constant SSV (set by SSV command)

SSV constant/offset
sets SSV value or offset (m/s) [1500.0]

ANGLEMODE mode
sets handling of beam angles during
raytracing [1]
 0: angles not changed before raytracing
 1: angles adjusted using Snell's Law for
    the difference between the surface sound
    velocity (SSV) and the sound speed at

the sonar depth in the SVP.
   2: angles adjusted using Snell's Law and
      the sonar array geometry for the
      difference between the surface sound
      velocity (SSV) and the sound speed at
      the sonar depth in the SVP.
TTMULTIPLY multiplier
   sets value multiplied by travel times [1.0]
SOUNDSPEEDREF boolean
   determines the handling of the sound
   speed reference for bathymetry [1]
   − note: if raytracing is turned off then
     this command implies correcting or
     uncorrecting using the SVP specified
     with the SVPFILE command
    0: produce "uncorrected" bathymetry
       referenced to a uniform 1500 m/s
       water sound speed model.
    1: produce "corrected" bathymetry
       referenced to a realistic water
       sound speed model.

STATIC BEAM BATHYMETRY OFFSETS:
 STATICMODE mode
    sets offsetting of bathymetry by
    per-beam statics [0]
     0: static correction off
     1: static correction by beam number
     2: static correction by acrosstrack beam angle
 STATICFILE filename
    sets static per-beam file path [no default]
    − static files are two-column ascii tables
    − if correction is by beam number then
      the beam # is in column 1 and
      the depth offset is in m in column 2
    − if correction is by beam angle then
      the beam angle (starboard positive)
      is in column 1 and
      the depth offset is in m in column 2

DRAFT CORRECTION:
 DRAFTMODE mode
    sets draft correction [0]
    − note: draft merged from navigation before
      draft correction applied
      0: no draft correction
      1: draft correction by offset
      2: draft correction by multiply
      3: draft correction by offset and multiply
      4: draft set to constant
 DRAFT constant
    sets draft value (m) [0.0]
 DRAFTOFFSET offset
    sets value added to draft (m) [0.0]

DRAFTMULTIPLY multiplier
      sets value multiplied by draft [1.0]

HEAVE CORRECTION:
  HEAVEMODE mode
      sets heave correction [0]
      − note: heave correction by offset and/or
        multiplication is added to any lever
        heave correction, and then either used in
        bathymetry recalculation or added to
        existing bathymetry
        0: no heave correction
        1: heave correction by offset
        2: heave correction by multiply
        3: heave correction by offset and multiply
  HEAVEOFFSET offset
      sets value added to heave (m)
  HEAVEMULTIPLY multiplier
      sets value multiplied by heave

LEVER CORRECTION:
  LEVERMODE mode
      sets heave correction by lever calculation [0]
      − note: lever heave correction is added to
        any heave correction by offset and/or
        multiplication, and then either used in
        bathymetry recalculation or added to
        existing bathymetry
        0: no lever calculation
        1: heave correction by lever calculation
  VRUOFFSETX constant
      sets athwartships offset of attitude sensor (m)
      − note: positive to starboard
  VRUOFFSETY constant
      sets fore-aft offset of attitude sensor (m)
      − note: positive forward
  VRUOFFSETZ constant
      sets vertical offset of attitude sensor (m)
      − note: positive down
  SONAROFFSETX constant
      sets athwartships offset of sonar receive array (m)
      − note: positive to starboard
  SONAROFFSETY constant
      sets fore-aft offset of sonar receive array (m)
      − note: positive forward
  SONAROFFSETZ constant
      sets vertical offset of sonar receive array (m)
      − note: positive down

ROLL CORRECTION:
  ROLLBIASMODE mode
      sets roll correction [0]
        0: no roll correction
        1: roll correction by single roll bias

        2: roll correction by separate port and
            starboard roll bias
    ROLLBIAS offset
        sets roll bias (degrees)
    ROLLBIASPORT offset
        sets port roll bias (degrees)
    ROLLBIASSTBD offset
        sets starboard roll bias (degrees)

PITCH CORRECTION:
    PITCHBIASMODE mode
        sets pitch correction [0]
            0: no pitch correction
            1: pitch correction by pitch bias
    PITCHBIAS offset
        sets pitch bias (degrees)

HEADING CORRECTION:
    HEADINGMODE mode
        sets heading correction [no heading correction]
        – note: heading merged from navigation before
          heading correction applied
          0: no heading correction
          1: heading correction using course
             made good
          2: heading correction by offset
          3: heading correction using course
             made good and offset
    HEADINGOFFSET offset
        sets value added to heading (degrees)

TIDE CORRECTION:
    TIDEMODE mode
        sets tide correction [0]
        – note: tide added to bathymetry after
          all other calculations and corrections
          0: tide correction off
          1: tide correction on
    TIDEFILE filename
        sets tide file path
    TIDEFORMAT constan
        sets tide file format [1]
        – tide files can be in one of four ASCII
          table formats
          1: format is <time_d tide>
          2: format is <yr mon day hour min sec tide>
          3: format is <yr jday hour min sec tide>
          4: format is <yr jday daymin sec tide>
        – time_d = decimal seconds since 1/1/1970
        – daymin = decimal minutes start of day

AMPLITUDE CORRECTION:
    AMPCORRMODE boolean
        sets correction of amplitude for

        amplitude vs grazing angle function
         0: amplitude correction off
         1: amplitude correction on
    AMPCORRFILE filename
        sets amplitude correction file path
        [no default]
    AMPCORRTYPE mode
        sets sidescan correction type [0]
         0: correction by subtraction (dB scale)
         1: correction by division (linear scale)
    AMPCORRSYMMETRY boolean
        forces correction function to be symmetric [1]
    AMPCORRANGLE constant
        sets amplitude correction reference angle
        (deg) [30.0]
    AMPCORRSLOPE mode
        sets amplitude correction slope mode [0]
         0: local slope ignored in calculating correction
         1: local slope used in calculating correction
         2: topography grid used in calculating correction
          but slope ignored
         3: local slope from topography grid used in
          calculating correction

  SIDESCAN CORRECTION:
   SSCORRMODE boolean
        sets correction of sidescan for
        amplitude vs grazing angle function
         0: sidescan correction off
         1: sidescan correction on
   SSCORRFILE filename
        sets sidescan correction file path
        [no default]
   SSCORRTYPE mode
        sets sidescan correction type [0]
         0: correction by subtraction (dB scale)
         1: correction by division (linear scale)
   SSCORRSYMMETRY boolean
        forces correction function to be symmetric [1]
   SSCORRANGLE constant
        sets sidescan correction reference angle
        (deg) [30.0]
   SSCORRSLOPE mode
        sets sidescan correction slope mode [0]
         0: local slope ignored in calculating correction
         1: local slope used in calculating correction
         2: topography grid used in calculating correction
          but slope ignored
         3: local slope from topography grid used in
          calculating correction
   AMPSSCORRTOPOFILE
        Sets topography grid used for correcting amplitude
        and sidescan

SIDESCAN RECALCULATION:
　SSRECALCMODE boolean
　　sets recalculation of sidescan for
　　Simrad multibeam data
　　　0: sidescan recalculation off
　　　1: sidescan recalculation on
　SSPIXELSIZE constant
　　sets recalculated sidescan pixel size (m) [0.0]
　　– a zero value causes the pixel size to
　　　be recalculated for every data record
　SSSWATHWIDTH constant
　　sets sidescan swath width (degrees) [0.0]
　　– a zero value causes the swath width
　　　to be recalculated for every data record
　SSINTERPOLATE constant
　　sets sidescan interpolation distance
　　(number of pixels)

METADATA INSERTION:
　METAVESSEL string
　　sets mbinfo metadata string for vessel
　METAINSTITUTION string
　　sets mbinfo metadata string for vessel
　　operator institution or company
　METAPLATFORM string
　　sets mbinfo metadata string for sonar
　　platform (ship or vehicle)
　METASONAR string
　　sets mbinfo metadata string for sonar
　　model name
　METASONARVERSION string
　　sets mbinfo metadata string for sonar
　　version (usually software version)
　METACRUISEID string
　　sets mbinfo metadata string for institutional
　　cruise id
　METACRUISENAME string
　　sets mbinfo metadata string for descriptive
　　cruise name
　METAPI string
　　sets mbinfo metadata string for principal
　　investigator
　METAPIINSTITUTION string
　　sets mbinfo metadata string for principal
　　investigator
　METACLIENT string
　　sets mbinfo metadata string fo data owner
　　(usually PI institution)
　METASVCORRECTED boolean
　　sets mbinfo metadata boolean for sound
　　velocity corrected depths
　METATIDECORRECTED boolean
　　sets mbinfo metadata boolean for tide
　　corrected bathymetry

METABATHEDITMANUAL boolean
  sets mbinfo metadata boolean for manually
  edited bathymetry
METABATHEDITAUTO boolean
  sets mbinfo metadata boolean for automatically
  edited bathymetry
METAROLLBIAS constant
  sets mbinfo metadata constant for roll bias
  (degrees + to starboard)
METAPITCHBIAS constant
  sets mbinfo metadata constant for pitch bias
  (degrees + forward)
METAHEADINGBIAS constant
  sets mbinfo metadata constant for heading bias
METADRAFT constant
  sets mbinfo metadata constant for vessel draft (m)

PROCESSING KLUGES:
KLUGE001 boolean
  enables correction of travel times in
  Hydrosweep DS2 data from the R/V Maurice
  Ewing in 2001 and 2002.
KLUGE002 boolean
  enables correction of draft values in
  Simrad data
  − some Simrad multibeam data has had an
    error in which the heave has bee added
    to the sonar depth (draft for hull
    mounted sonars)
  − this correction subtracts the heave
    value from the sonar depth
KLUGE003 boolean
  enables correction of beam angles in
  SeaBeam 2112 data
  − a data sample from the SeaBeam 2112 on
    the USCG Icebreaker Healy (collected on
    23 July 2003) was found to have an error
    in which the beam angles had 0.25 times
    the roll added
  − this correction subtracts 0.25 * roll
    from the beam angles before the bathymetry
    is recalculated by raytracing through a
    water sound velocity profile
  − the mbprocess parameter files must be
    set to enable bathymetry recalculation
    by raytracing in order to apply this
    correction
KLUGE004 boolean
  deletes survey data associated with duplicate
  or reversed time tags
  − if survey data records are encountered
    with time tags less than or equal to the
    last good time tag, an error is set and
    the data record is not output to the

            processed data file.
        KLUGE005 boolean
            replaces survey record timestamps with
            timestamps of corresponding merged navigation
            records
            – this feature allows users to fix
              timestamp errors using MBnavedit and
              then insert the corrected timestamps
              into processed data
        KLUGE006 boolean
                changes sonar depth / draft values without
            changing bathymetry values
        KLUGE007 boolean
            processing kluge 007 (not yet defined)
            – occasionaly odd processing problems will
              occur that are specific to a particular
              survey or sonar version
            – mbprocess will allow one-time fixes to
              be defined as "kluges" that can be turned
              on through the parameter files.

ANCILLARY DATA FILES

MB-System also uses a number of ancillary data files, most of which relate to **mbprocess** in some way. By default, these ancillary data files are named by adding a short suffix to the primary data file name (e.g. ".par", ".svp", ".esf", ".nve")

The common ancillary files are listed below. The example names given here follow from an input swath data file name of mydata.mb71.

The processing parameter file used by **mbprocess** has an ".par" suffix. These files are generated or modified by **mbset**, **mbedit**, **mbnavedit**, **mbvelocitytool**, **mbnavadjust**, and **mbclean**.
        mydata.mb71.par

The most prominent ancillary files are metadata or "inf" files (created from the output of **mbinfo**). Programs such as **mbgrid** and **mbm_plot** try to check "inf" files to see if the corresponding data files include data within desired areas. The program **mbprocess** automatically generates an "inf" file for any processed output swath file. Also, the program **mbdatalist** is often used to create or update "inf" files for large groups of swath data files.
        mydata.mb71.inf
        mydata.mb71.inf

The "fast bath" or "fbt" files are generated by copying the swath bathymetry to a sparse, quickly read format (format 71). Programs such as **mbgrid**, **mbswath**, and **mbcontour** will try to read "fbt" files instead of the full data files whenever only bathymetry information are required. The program **mbprocess** automatically generates an "fbt" file for any processed output swath file. Also, the program **mbdatalist** is often used to create or update "fbt" files for large groups of swath data files. These files are not generated or used when the original swath data is already in a compact bathymetry-only data format.
        mydata.mb71.fbt

The "fast nav" or "fnv" files are just ASCII lists of navigation generated using **mblist** with a −O*tMXYHSc* option. Programs such as **mbgrid**, **mbswath**, and **mbcontour** will try to read "fnv" files instead of the full data files whenever only navigation information are required. These files are not generated or used when the original data is already in a single-beam or navigation data format.
        mydata.mb71.fnv

The bathymetry edit save file generated by **mbedit** and **mbclean** has an ".esf" suffix.
    mydata.mb71.esf

A water sound velocity profile (SVP) file generated by **mbvelocitytool** has an ".svp" suffix unless the user specifies otherwise.
    mydata.mb71.svp

Water sound velocity profile (SVP) files generated by **mbsvplist** also use the ".svp" suffix. However, multiple SVP files may be extracted from each input swath file, so the files are numbered using a "_YYY.svp" suffix, where YYY increments from 001.
    mydata.mb71_001.svp
    mydata.mb71_002.svp
    mydata.mb71_003.svp

Edited navigation files generated by **mbnavedit** have an ".nve" suffix:
    mydata.mb71.nve
These navigation files can be read independently using format 166.

Adjusted navigation files generated by **mbnavadjust** have an ".naY" suffix, where "Y" is a number between 0-9. The **mbnavadjust** package may be used multiple times for a survey; the adjustments are numbered sequentially from "0":
    mydata.mb71.na0
    mydata.mb71.na1
    mydata.mb71.na2
and so on. These navigation files can be read independently using format 166.

OPTIONS

−E

This option causes **mbset** to require all processing modes to be explicitly set by **−P** calls. Normally, **mbset** will implicitly set some modes based on the parameters applied. For example, if a user applies **−P***SVPFILE:best.svp*, **mbset** would normally set the bathymetry recalculation mode on so that the SVP file specified actually gets used.

−I *infile*

Swath data file for which an **mbprocess** parameter file will be created or updated, or a datalist file containing a list of input swath data files and/or other datalist files. If *infile* is a datalist file, then **mbset** will attempt to update or create the parameter files for all swath data files identified by recursively reading *infile*. Default *infile*: datalist.mb-1

−L

If given once, this option causes **mbset** to look for any edit save files and navigation files with expected names and set the **mbprocess** parameters so that these files are used. If multiple navigation files are available (reflecting use of **mbnavedit** and one or more uses of **mbnavadjust**), then the latest (highest numbered) **mbnavadjust** solution is used. If **−L** is given twice, **mbset** will also look for any SVP files with expected names and set the **mbprocess** parameters so that these files

are used for recalculating bathymetry by raytracing. If multiple SVP files are available (reflecting use of **mbsvplist** and **mbvelocitytool**), then the file derived from **mbvelocitytool** is used. If **−L** is given three times or more, then **mbset** will not look for any ancillary files, but instead reset the paths to all output files to be "local", meaning located in the same directory as the input file. This special option allows users to fix parameter files containing full paths for output files (as generated by early versions of this program).

−H This "help" flag causes the program to print out a description of its operation and then exit immediately.

−P *PARAMETER:value* The **−P** option of **mbset** is used to modify a single **mbprocess** parameter command. Here *PARAMETER* may be any of the processing parameter names listed above, and *value* is the corresponding value to be set. This option can be invoked as many times as desired on the command line, allowing **mbset** to set multiple **mbprocess** processing parameters and modes. The separater between *PARAMETER* and *value* can be either ':' or '='. Only the first ':' or '=' acts as a separater; later instances of these characters are taken as part of *value*.

−V Normally, **mbset** works "silently" without outputting anything to the stderr stream. If the **−V** flag is given, then **mbset** works in a "verbose" mode and outputs the program version being used and lists the processing parameters output to the **mbprocess** parameter file.

EXAMPLES

Suppose the user has a Simrad EM120 data file called "0051_20010829_223755.mb57" that requires processing.

Editing the bathymetry data in this file with mbedit will generate an edit save file "0051_20010829_223755.mb57.esf" and an mbprocess parameter file "0051_20010829_223755.mb57.par". The contents of the parameter file are:

```
## MB-System processing parameter file

              METAHEADINGBIAS 0.000000
              METADRAFT 0.000000
              ##
              ## Processing Kluges:
```

Editing   the   navigation   with   mbnavedit   will   generate   a   navigation   file   named
"0051_20010829_223755.mb57.nve"   and   will   modify   the   parameter   file.   The   changed   lines   in
"0051_20010829_223755.mb57.par" are:

```
              ## Navigation Merging:
              NAVMODE 1
              NAVFILE /data/0051_20010829_223755.mb57.nve
              NAVFORMAT 9
              NAVHEADING 1
              NAVSPEED 1
              NAVDRAFT 1
              NAVATTITUDE 1
```

At this point, running **mbprocess** on "0051_20010829_223755.mb57" will apply the bathymetry flags from
mbedit and merge the navigation from **mbnavedit**, but will not modify the data in any other way.

If the user wants to recalculate the bathymetry using an SVP file "0051_20010829_223755.mb57.svp" and
a roll bias correction of +0.5 degrees, the following will suffice:

```
    mbset −I 0051_20010829_223755.mb57          −PSVPFILE:0051_20010829_223755.mb57.svp
−PROLLBIAS:0.5          −PDRAFT:1.95          −V
```

The affected lines in "0051_20010829_223755.mb57.par" are:

```
              ##
              ## Bathymetry Recalculation:
              SVPMODE 1
              SVPFILE 0051_20010829_223755.mb57.svp
              SSVMODE 0
              SSV 0.000000
              TTMODE 0
              TTMULTIPLY 1.000000
              ANGLEMODE 0
              SOUNDSPEEDREF 1
              ##
              ## Draft Correction:
              DRAFTMODE 4
              DRAFT 1.950000
              DRAFTOFFSET 0.000000
              DRAFTMULTIPLY 1.000000
              ##
```

Roll Correction:
