

NAME

mbtime – Translate between calendar time values and unix time.

VERSION

Version 5.0

SYNOPSIS

mbtime [-**Mtime_d** -**Tyear/month/day/hour/minute/second** -**V** -**H**]

DESCRIPTION

The program **mbtime** converts time values between unix time (seconds since 1970/01/01 00:00:00.000000) and calendar time (e.g. 2008/006/05/17/24/32.000000). Unix time is also known as POSIX time or epoch time, and are typically represented in **MB-System** documentation (and source code) as "time_d" values. The input time is set using the command line arguments -**Mtime_d** for epoch seconds and -**Tyear/month/day/hour/minute/second** for calendar time. The output time (in the form not specified as input) is written to stdout.

OPTIONS

- H** This "help" flag cause the program to print out a description of its operation and then exit immediately.
- M** *time_d*
Sets the input time to be *time_d* in unix time, which is defined as seconds since 00:00:00.000000 01 January 1970. If -**M** is specified, this time will be converted to calendar time and output to stdout in the form
yyyy/mm/dd/hh/mm/ss.ssssss
- T** *year/month/day/hour/minute/second*
Sets the input time to be *year/month/day/hour/minute/second*. If -**T** is specified, this time will be converted to *time_d* in epoch (Unix) seconds, which are seconds since 00:00:00.000000 01 January 1970. The *time_d* value will be output to stdout.
- V** Normally, **mbtime** only prints out the converted time. If the -**V** flag is given, then **mbtime** works in a "verbose" mode and also outputs the program version being used.

EXAMPLES

Suppose one wishes to convert the current time (06 June 2008 18:37:14.000000) to unix seconds. The following command:

```
mbtime -T2008/06/06/18/37/14.0
```

yields the following result:

```
1212777434.000000
```

Suppose one wishes to convert the unix time 1212777434.0 to calendar time. The following command:

```
mbtime -M1212777434.0
```

yields the following result:
2008/06/06/18/37/14.000000
